

IN THE CLAIMS:

Please cancel claims 5, and amend the claims as follows:

1. (Currently Amended) A computer-implemented method for managing memory available for dynamic allocation during execution of code containing a plurality of memory allocators and a plurality of memory deallocators, comprising:

providing a computer user interface;

allowing a user to establish, via the computer user interface, a relationship between one or more of the memory deallocators and one or more of the memory allocators, wherein the relationship requires that memory space allocated by the one or more allocators is freed by the one or more deallocators and wherein the relationship is represented by a data structure containing a reference to the one or more of the memory deallocators and the one or more of the memory allocators;

allowing the code to execute;

upon a call to the one or more deallocators to free a memory space, determining whether the relationship is violated, wherein determining whether the relationship is violated comprises determining that the memory space was allocated by an allocator different from the one or more memory allocators; and

if so, notifying the user.

2. (Original) The method of claim 1, wherein notifying the user comprises halting execution of the code.

3. (Original) The method of claim 1, wherein notifying the user comprises halting execution of the code and displaying a status message to the user.

4. (Original) The method of claim 1, if the relationship is not violated, freeing the memory space.

5. (Cancelled)

6. (Currently Amended) A computer-implemented method for managing memory available for dynamic allocation during execution of code containing a plurality of memory allocators and a plurality of memory deallocators, comprising:

establishing a relationship between a user-selected memory deallocator and a user-selected memory allocator, wherein the relationship requires that memory space freed by the user-selected deallocator have been allocated by the user-selected allocator, and wherein the relationship is represented by a data structure containing a reference to the user-selected deallocator and the user-selected allocator, and wherein the relationship is violated upon determining that the memory space freed by the user-selected deallocator was allocated by an allocator different from the user-selected allocator;

allowing the code to execute;

upon a call to the user-selected deallocator to free a memory space, determining whether the memory space was allocated by the user-selected allocator; and

if ~~so~~ not, notifying the user that the relationship is violated.

7. (Original) The method of claim 6, wherein notifying the user comprises halting execution of the code and displaying a status message to the user.

8. (Previously Presented) A method for managing memory available for dynamic allocation during execution of code containing a plurality of memory allocators and a plurality of memory deallocators, comprising:

setting an upper limit on the amount of memory space an allocator can allocate during execution of the code, wherein the upper limit is specific to the allocator; wherein the upper limit and a reference to the allocator are stored in a data structure, thereby relating the upper limit to the allocator;

during execution of the code, tracking the amount of memory space allocated by the allocator; and

when the amount of memory space allocated exceeds the limit, notifying a user.

9. (Original) The method of claim 8, wherein the step of tracking comprises: determining whether the allocator is called to allocate memory and, if so, incrementing a counter; and

determining whether a deallocator is called to deallocate memory allocated by the allocator and, if so, decrementing the counter.

10. (Original) The method of claim 8, wherein the step of tracking comprises incrementing

a counter in the event of memory allocation by the allocator and decrementing the counter in the event of memory deallocation of memory space allocated by the allocator.

11. (Original) The method of claim 8, wherein notifying the user comprises halting execution of the code.

12. (Original) The method of claim 8, wherein the upper limit is independent of other memory size limitations.

13. (Original) The method of claim 8, wherein the upper limit is not a limit on a stack size.

14-22. (Canceled)

Please add the following new claims:

23. (New) A computer readable storage medium containing a program which, when executed, performs an operation for managing memory available for dynamic allocation

during execution of code containing a plurality of memory allocators and a plurality of memory deallocators, the operation comprising:

- establishing a relationship between a user-selected memory deallocator and a user-selected memory allocator, wherein the relationship is represented by a data structure containing a reference to the user-selected deallocator and the user-selected allocator, and wherein the relationship requires that memory space freed by the user-selected deallocator have been allocated by the user-selected allocator;

- allowing the code to execute;

- upon a call to the user-selected deallocator to free a memory space, determining whether the memory space was allocated by the user-selected allocator; and

- if so, notifying the user that the relationship is violated.

24. (New) The computer readable storage medium of claim 23, wherein notifying the user comprises halting execution of the code and displaying a status message to the user.

25. (New) A computer readable storage medium containing a program which, when executed, performs an operation for managing memory available for dynamic allocation during execution of code containing a plurality of memory allocators and a plurality of memory deallocators, the operation comprising:

- setting an upper limit on the amount of memory space an allocator can allocate during execution of the code, wherein the upper limit is specific to the allocator;

- during execution of the code, tracking the amount of memory space allocated by the allocator; and

- when the amount of memory space allocated exceeds the limit, notifying a user.

26. (New) The computer readable storage medium of claim 25, wherein the step of tracking comprises:

- determining whether the allocator is called to allocate memory and, if so, incrementing a counter; and

determining whether a deallocator is called to deallocate memory allocated by the allocator and, if so, decrementing the counter.

27. (New) The computer readable storage medium of claim 25, wherein the step of tracking comprises incrementing a counter in the event of memory allocation by the allocator and decrementing the counter in the event of memory deallocation of memory space allocated by the allocator.

28. (New) The computer readable storage medium of claim 25, wherein notifying the user comprises halting execution of the code.

29. (New) The computer readable storage medium of claim 25, wherein the upper limit is independent of other memory size limitations.

30. (New) The computer readable storage medium of claim 25, wherein the upper limit is not a limit on a stack size.

31. (New) A computer system comprising an output device, a memory device, one or more processors, code resident in the memory device and containing a plurality of memory allocator calls and a plurality of memory deallocator calls, a heap manager resident in the memory device to allocate and free memory of the memory device and a debugger program resident in the memory device; the debugger program comprising a debugger user interface configured to at least:

allow a user to view allocation/deallocation history information at a user-specified memory location; and

allow a user to establish a relationship between a memory deallocator call and a memory allocator call, wherein the relationship is represented by a data structure containing a reference to the user-selected deallocator and the user-selected allocator, and wherein the relationship requires that memory space allocated by the memory

allocator call is freed by the memory deallocator call and a violation of the requirement causes the debugger user interface to notify the user.
